

March 13 2025

Problem: We are having issues deserializing the image data given to us by the API. It seems like a TIFF file which Python can handle well, but when using Java, we run into many issues. Email is written to DEBS Coordinators.

5:17PM: Coordinators confirm that images are TIFF with Zip compression. They also confirm that the Apache Commons imaging library does not natively support it as a compression format. They then upload the input data compressed with LZW instead of ZIP on the sharepoint. We are still having issues deserializing and are working with coordinators to figure out how to best solve the issue.

March 15 2025

Group decides to use dummy data for the images so the rest of the pipeline can be made and tested.

- Size of tiles are 250,000 by 500
- Java is having trouble with creating these large arrays time wise
- Dummy tiles will be 10 by 10 as of now

March 17 2025

Group coordinates who will do what for everything but the code. That being, who will:

- 1) Create what parts of the presentation
- 2) Upload meeting notes
- 3) Upload documentation to run our local solution.

From Prathmesh:

Things that need to be done/are being done:

- 1) Finish code sample - I am working on this
- 2) Finish presentation - Owen, Tanish, and Prathmesh finish this up and divide slides for tomorrow.
- 3) Modernize the meeting notes + add notes about emails we wrote and issues we ran into + current architecture talks from our meeting with the prof. These meeting notes serve as participation and need to be uploaded to the git.
- 4) Create documentation for running my code locally, which the TA will test for our grade.
